## Consumption Comparison Report

CCF is a volumetric measure of natural gas. It represents the amount of gas contained in a space equal to one hundred cubic feet. A therm is a measurement of energy, or heat, equal to 100,000 BTU (British Thermal Units).

Heating degree day (HDD) is a quantitative index designed to reflect the demand for energy needed to heat a home or business. This index is derived from daily temperature observations, and the heating requirements for a given structure at a specific location are considered to be directly proportional to the number of heating degree days at that location.

\* Represents Your Consumption and Actual Heating Degree Days From 7/7/2017 To 6/7/2019
